Primary A-B-C-D-E Survey

- **Airway**: Decision to intubate should be based on physician judgment. Assess for any of these indications for intubation:
  - Face and neck burns
  - Singed nasal hair
  - Oral or lip burns
  - Soot in upper airway
  - Carbonaceous sputum
  - Dyspnea / stridor
  - Tachypnea
  - Hoarseness
  - Sore throat
  - Cough
  - Rhonchi
  - Decreased level of consciousness
  - Associated injuries

- **Breathing and ventilation**
- **Circulation**
- **Disability**
- **Environment**: Exposure / environmental control
  - Remove all clothing and jewelry to complete assessment
  - Maintain temperature
  - Cover with dry sheets and blankets to prevent hypothermia

Secondary Survey

- Complete head-to-toe examination
- Calculate burn total body surface area (TBSA)

Fluid Resuscitation

Fluid protocols are **guidelines only**. Use as a starting point.

- Adjust fluids according to individual response
- **GOAL**: Urinary output (U.O.) 0.5–1.0 ml/kg/hr (actual body weight)
- Insert urinary catheter; consider placement of central line.

Burns 15–40% TBSA without Inhalation Injury

- **Parkland Formula**
  - Initial Fluids
    - LR 4 ml x % TBSA x weight (kg)
    - **For the first hour only**, calculate infusion rate, based on one-half the total fluid over 8 hrs.
    - **After the first hour**, titrate LR, based on hourly U.O. for the first 48 hours post-burn
      - U.O. < 0.5 ml/kg/hr, increase by 30%
      - U.O. 0.5–1 ml/kg/hr, keep at current rate
      - U.O. > 1 ml/kg/hr, decrease by 30%

- DO NOT give fluid bolus unless directed by Burn Attending.

Burns > 40% TBSA or 30% with Inhalation Injury

- **West Penn Formula**
  - Initial Fluids
    - LR at 83 ml/hr at a constant rate.
      - **DO NOT INCREASE** for the first 48 hours post-burn
    - FFP 75 ml/kg / 24 = hourly rate for initial rate, then titrate. FFP titration based on hourly U.O. for the first 48 hours
      - U.O. < 0.5 ml/kg/hr, increase by 30%
      - U.O. 0.5–1 ml/kg/hr, no change
      - U.O. > 1 ml/kg/hr, decrease by 30%

- DO NOT give fluid bolus unless directed by Burn Attending.

Pain Management during Wound Care: SICU

Consider lower doses for opioid-naïve and elderly patients.

**Analgesia**:

- **Morphine sulfate** 4-12 mg IV every 15 minutes prn for pain score > 4/10 during dressing change
  - Initial dose 10 minutes before treatment to start
- **Hydromorphone** 1-2 mg IV every 15 minutes prn for pain score > 4/10 during dressing change
  - Initial dose 10 minutes before treatment to start
• **Ketamine** should be considered as an additive analgesic for patients who are refractory to standard management of burn dressing changes using morphine with midazolam or hydromorphone with midazolam
  - Administer ketamine 50-100 mg IVP, over at least 1 minute, immediately prior to dressing change
    - Ketamine has a very fast onset (1−2 minutes)
    - If needed, may administer 50 mg IV every 15 minutes prn pain score > 4/10 during dressing change
    - Max dose 200 mg IVP per dressing change
  - Ketamine **MUST** be given as a slow IVP over at least 1 minute in order to prevent emergence phenomenon (e.g., vivid dreams, hallucinations, delirium)
    - In addition, ketamine **MUST** always be given with a benzodiazepine (e.g., midazolam, lorazepam) in order to prevent emergence phenomenon

**Anxiolysis:**
• For initial dressing change dose titration:
  - Midazolam 2−5 mg IV
    - 10 minutes before start of treatment
    - Wait at least 2 minutes to evaluate for effect
  - If necessary, continue to titrate to maximum total dose of 5 mg using 1 mg increments to the appropriate level of patient comfort
  - Document total amount given during titration phase for future use during dressing change
  - May repeat total titration dose every 1 hour prn during dressing change if duration > 60 minutes
• For subsequent dressing changes:
  - Midazolam dose based on titration during initial dressing change
    - Review dose documented for previous dressing changes
    - Administer dose 10 minutes prior to start of treatment
    - May repeat dose every 1 hour prn during dressing change if duration > 60 minutes

**Note:** Should a patient require continuous infusion sedation or analgesia, follow the OSUWMC Surgical ICU, Neurocritical Care, & Ross Sedation and Analgesia protocol.

---

**Pain Management During Wound Care: Burn Center**

**Analgesia:**
• **Oxycodone/acetaminophen** 5/325 mg 1-2 tabs PO 60 minutes prior to dressing change
  - May repeat during dressing change if duration greater than 1 hour
• **Fentanyl citrate (Actiq)** 400 mcg transmucosal lozenge every 15 minutes for 2 doses prn for pain score > 8/10 during dressing change
  - **Initial dose 10 minutes before treatment to start**
  - If patient has had previous dressing changes, initial dose can be altered (contact prescriber to update orders) based on prior opioid tolerance
    - If patient does not tolerate dressing change with transmucosal fentanyl, IV analgesia with hydromorphone or morphine can be considered

**Anxiolysis**
• For initial dressing change dose titration:
  - Midazolam 1-3 mg IV (10 minutes before start of treatment)
    - Give midazolam 1 mg and wait at least 2 minutes to evaluate for effect
    - If necessary, may administer up to maximum total dose of 3 mg using 0.5 mg increments based on patient's level of anxiety
    - Document total amount given during initial dressing change for future use during dressing change
    - May repeat total dose every 1 hour prn during dressing change if duration > 60 minutes
• For subsequent dressing changes:
  - Midazolam dose based on total dose used during initial dressing change
  - Patients receiving IV midazolam on the burn center floor are required to have specific monitoring per protocol

**Special Burn Populations**

**Major Burns, Inhalation Injury, Shock, or Elderly**
• Monitor U.O. and peripheral pulses to affected extremities hourly
  - Goal for U.O. is 0.5−1.0 ml/kg/hr
• Add arterial line to monitor BP and blood gases

**Carbon Monoxide / Cyanide Toxicity**
• Monitor carboxyhemoglobin
• Administer oxygen
• Consider administration of sodium thiosulfate as cyanide antidote if not already given by EMS
• Consult Hyperbaric Medicine
Electrical Injury
- Monitor U.O. hourly, urine myoglobin x 1
- Obtain serial CK and troponin x 24 hrs
- If port-wine-colored urine, titrate IV fluids to U.O. 1.0–2.0 ml/kg/hr until urine clears
- After urine clears, adjust fluids to maintain IV fluids to U.O. 0.5–1.0 ml/kg/hr

Alcohol Intoxication
- May increase volume of fluid
  - Adjust fluids to maintain U.O. 0.5–1.0 ml/kg/hr.
- If symptoms of alcohol withdrawal, see OSUWMC Alcohol Withdrawal guideline

Frostbite
- Consult Burn Service as soon as possible once frostbite is recognized
  - Treatment for frostbite is time sensitive

Nutrition
- Begin tube feeding as soon as possible
  - GOAL: within 6 hours from admission
- Insert nasoduodenal (preferred) or nasogastric tube
- Enteral better than parenteral
- May be proportional to TBSA involved
- Immune modulating nutrition with glutamine

Burn Wound Care
- Clean and debride wound
- Apply clean and dry wound dressing until definitive wound care treatment is ordered

Tetanus
- Determine date of last tetanus toxoid vaccine.
- If > 5 years or unknown, administer both:
  - Tetanus toxoid vaccine: Tdap (with pertussis), or Td 0.5 ml IM x 1, and
  - Tetanus immune globulin (250 units IM x 1)

Burn-Related Order Sets
- BURN: 9 WEST DOAN PROCEDURE CARE [1684]
- BURN: ADMISSION CRITERIA CRITICAL CARE BURN [2111]
- BURN: ADMISSION NON ICU ADMISSION BURN [2109]
- BURN: FOCUSED WOUND CARE [2171]

Reference

Quality Measures
- Average time from admission to first tube feeding
  - Percent of patients who received first feeding within 6 hours of admission
- Average time from admission to fluid resuscitation
  - Parkland Formula
  - West Penn Formula
- Percent of patients admitted to services other than Burn
  - Appropriateness of off service admission based on ABA criteria
  - Percent with a Burn Service Consult upon admission
